

软件分析

抽象解释

熊英飞 北京大学

复习: 符号分析

- 正 ={所有的正数}
- 零={0}
- 负= {所有的负数}

• 乘法运算规则:

- 正*正=正
- 正*零=零
- 正*负=负

- 负*正=负
- 负*零=零
- 负*负=正

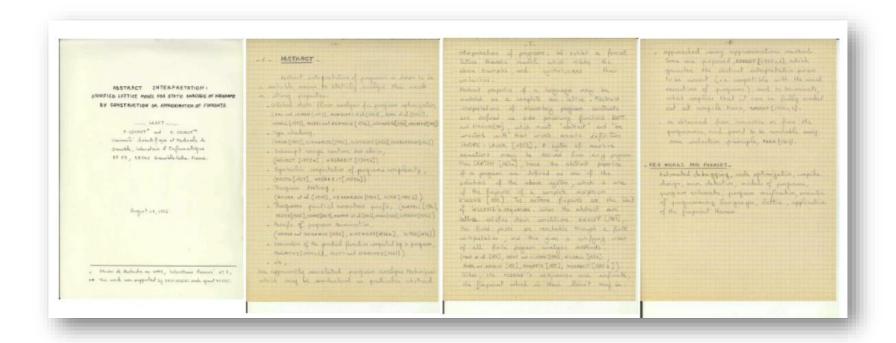

如何知道该抽象运算 是正确的?

- 零*正=零
- 零*零=零
- 零*负=零

Programming Languages Achievement Award

Given by ACM SIGPLAN to recognize an individual or individuals who has made a significant and lasting contribution to the field of programming languages. The contribution can be a single event or a life-time of achievement. The award includes a prize of \$5,000. The award is presented at SIGPLAN's PLDI conference the following June.

Recipients of the Achievement Award

2013: Patrick and Radhia Cousot

Patrick and Radhia Cousot are the co-inventors of abstract interpretation, a unifying theory of sound abstraction and approximation of structures involved in various domains of computer science, such as formal semantics, specification, proof, and verification. In particular, abstract interpretation has had a major impact on the development of the static analysis of software. In their original work, the Cousots showed how to relate a static analysis to a language's standard semantics by means of a second, abstract semantics that makes precise which features of the full language are being modeled and which are being discarded (or abstracted), providing for the first time both a formal definition of and clear methodology for designing and proving the correctness of static analyses. Subsequently, the Cousots contributed many of the building blocks of abstract interpretation in use today, including chaotic iteration, widening, narrowing, combinations of abstractions, and a number of widely used abstract domains. This work has developed a remarkable set of intellectual tools and has found its way into practice in the form of widely used libraries and frameworks. Finally, the Cousots and their collaborators have contributed to demonstrating the utility of static analysis to society. They led the development of the Astric static analyzer, which is used in the medical, automotive, and aerospace industry for verifying the absence of a large class of common programming errors in low-level embedded systems code. This achievement stands as one of the most substantial successes of program verification to date.

所获荣誉

TEST NILVES

2018年 约翰·冯诺依曼奖

Patrick Cousot awarded John von Neumann Medal

Patrick Cousot is the recipient of the IEEE John von Neumann medal, given "for outstanding achievements in computer-related science and technology".

RECIPIENTS

2018 PATRICK COUSOT
Professor, New York University,
New York, New York, USA

"For introducing abstract interpretation, a powerful framework for automatically calculating program properties with broad application to verification and optimization."

抽象解释

• 主要解释抽象空间和具体空间的关系

抽象空间

具体空间

抽象解释

- · 具体化函数γ将抽象值映射为具体值的集合
 - γ(正) ={所有的正数}
 - $\gamma(T) = \emptyset$
- 抽象化函数α将具体值的集合映射为抽象值
 - α({所有的正数})=正
 - $\alpha(\{1,2\}) = \mathbb{E}$
 - $\alpha(\{-1,0\}) = \mathbb{R}$
- 假设抽象域上存在偏序关系⊑
 - 简便起见,这里假设具体值集合上的偏序关系为子集关系。但抽象解释理论支持其他偏序关系,比如超集。

伽罗瓦连接 Galois Connection

• 我们称γ和α构成抽象域虚和具体域集合的全集 **D**之间的一个伽罗瓦连接,记为

$$(\mathbf{D},\subseteq) \leftrightharpoons_{\alpha}^{\gamma} (\mathbf{E},\subseteq)$$

• 当且仅当

 $\forall X \in \mathbf{D}, \ \exists \in \mathbf{\Xi} : \alpha(X) \sqsubseteq \exists \in X \subseteq \gamma(\exists)$

定理

- (D,⊆) $\leftrightharpoons_{\alpha}^{\gamma}$ (虚,⊆) 当且仅当以下所有公式成立
- α 是单调的: $\forall X, Y \in \mathbf{D}: X \subseteq Y \Rightarrow \alpha(X) \sqsubseteq \alpha(Y)$
- γ 是单调的: \forall 甲, 乙 ∈ **虚**: 甲 ⊑ 乙 \Rightarrow γ (甲) ⊆ γ (乙)
- $\gamma \circ \alpha$ 不变或增大输入: $\forall X \in \mathbf{D}: X \subseteq \gamma(\alpha(X))$
- α γ 不变或缩小输入: \forall 甲 ∈ **愿**: $\alpha(\gamma(\mathbb{P}))$ \subseteq \mathbb{P}

证明

- $\bullet \Rightarrow$
 - $\forall X \in \mathbf{D}: X \subseteq \gamma(\alpha(X))$
 - 由 $\alpha(X)$ $\sqsubseteq \alpha(X)$ 和伽罗瓦连接定义可得 $X \subseteq \gamma(\alpha(X))$
 - $\forall \exists \exists \exists \alpha (\gamma(\exists)) \subseteq \exists \exists \alpha (\gamma(\exists)) \subseteq \exists \beta (\exists \beta (\exists)) \subseteq \exists \beta (\exists \beta (\exists \beta)) \subseteq \exists \beta (\exists \beta (\exists \beta)) \subseteq \exists \beta (\exists$
 - 由 γ (甲) ⊆ γ (甲)和伽罗瓦连接定义可得 $\alpha(\gamma(\Psi))$ ⊑ 甲
 - $\forall X, Y \in \mathbf{D}: X \subseteq Y \Rightarrow \alpha(X) \sqsubseteq \alpha(Y)$
 - $X \subseteq Y \subseteq \gamma(\alpha(Y)) \Rightarrow \alpha(X) \sqsubseteq \alpha(Y)$
 - $\forall \exists \exists \exists \exists \exists \forall \gamma \in \mathcal{A}$: $\exists \exists \exists \exists \forall \gamma \in \mathcal{A}$
 - $\alpha(\gamma(\mathbb{P})) \subseteq \mathbb{P} \subseteq \mathbb{Z} \Rightarrow \gamma(\mathbb{P}) \subseteq \gamma(\mathbb{Z})$

证明

- $\alpha(X) \sqsubseteq \mathbb{P}$
- $\Rightarrow \gamma(\alpha(X)) \subseteq \gamma(\mathbb{P})$
- $\Rightarrow X \subseteq \gamma(\mathbb{P})$

【y的单调性】

 $X \subseteq \gamma(\alpha(X))$

- $X \subseteq \gamma(\mathbb{P})$
- $\Rightarrow \alpha(X) \sqsubseteq \alpha(\gamma(\mathbb{P}))$

• $\Rightarrow \alpha(X) \sqsubseteq \Box$

【α的单调性】

函数抽象

- 给定伽罗瓦连接(D,⊆) $\leftrightharpoons_{\alpha}^{\gamma}$ (\pounds , \sqsubseteq)
- 给定D上的函数f和虚上的函数S
- - $\alpha \circ f \circ \gamma(\mathbb{P}) \sqsubseteq \mathfrak{P}(\mathbb{P})$
- - $\alpha \circ f \circ \gamma = \mathbb{R}$
- - $f \circ \gamma = \gamma \circ \mathcal{P}$
- 最佳抽象总是存在,但精确抽象不一定存在

补充: 形式语义

- 语法: 刻画程序的书写方法
- 语义: 刻画程序所描述的输入输出之间的关系
- 三大语义体系:
 - 操作语义: 描述语句对当前系统状态的修改操作
 - 指称语义: 把语句描述成从输入状态到输出状态的函数
 - 公理语义: 描述语句执行前所需要满足的条件和输入会满足的条件

补充: 指称语义

程序状态: 从变量到值的映射

语法	指称语义		
a=b+1	$f(x) = x[a \mapsto x[b] + 1]$		
$s_1; s_2$	$f_2 \circ f_1$		
if (c) then s_1 else s_2	$f(x) = \begin{cases} f_1(x), & x \vdash c \\ f_2(x), & x \vdash \neg c \end{cases}$		
while (c) s_1	$f(x) = \begin{cases} f \circ f_1(x), & x \vdash c \\ x, & x \vdash \neg c \end{cases}$		

数据流分析的安全性-定义

- 考虑指称语义
- 假设抽象域为具体状态的上近似
- 令程序状态集合的全集为D, 状态的抽象域为虚, 二 者形成一个伽罗瓦连接。
- 对于原子语句 S_i ,令 f_i 为该语句的具体语义, S_i 是其安全抽象
 - 我们假设 f_i 自然扩展到状态集合,即 $f_i(X) = \{f_i(x) \mid x \in X \land f_i(x) \mid x \in X \}$
 - · 容易看出在状态集合上fi是单调的

数据流分析的安全性

- 之前我们证明了
 - 对控制流图上任意结点 v_i 和从entry到 v_i 的所有可行路 径集合P,满足DATA v_i $\supseteq \sqcup_{v_1v_2v_3...v_i \in P} f_{v_i} \circ f_{v_{i-1}} \circ \cdots \circ f_{v_1}(I_{entry})$
 - 即数据流分析相对"所有路径结果的合并"是安全的
- 下面我们论证"所有路径结果的合并"是安全的

因为本节只讨论上近似,替换交汇操作为合并操作以方便理解

路径语义提取函数

• 定义如下函数p, 将语句映射到函数的集合, 每个函数代表一条路径

语句s	路径语义提取函数 p (s)		
原子语句 S_i	${对应指称语义}f_{i}$		
$s_1; s_2$	$p(s_1) \times p(s_2)$ (对应元素用。组合)		
if (c) then s_1 else s_2	$p(s_1) \cup p(s_2)$		
while (c) s_1	$\{ID\} \cup p(s_1) \cup p(s_1) \times p(s_1) \cup p(s_1) \times p(s_1) \times p(s_1) \times p(s_1), \dots$ (无限集合)		

- 结构归纳证明如下定理
 - 给定状态(x,y)和程序P,如果 $f_p(x) = y$,则有 $\exists f \in p(x).f(x) = y$

单条路径的安全性

- 引理: $\Theta_2 \circ \Theta_1 \oplus f_2 \circ f_1$ 的安全抽象。
- 证明:
 - $\alpha \circ f_1 \circ \gamma(\mathbb{P}) \sqsubseteq \mathfrak{P}_1(\mathbb{P})$

 I_1 安全性】

• $\Rightarrow f_1 \circ \gamma(\mathbb{P}) \sqsubseteq \gamma \circ \mathfrak{P}_1(\mathbb{P})$

【伽罗瓦连接定义】

• $\Rightarrow \alpha \circ f_2 \circ f_1 \circ \gamma(\mathbb{P}) \sqsubseteq \alpha \circ f_2 \circ \gamma \circ \mathfrak{P}_1(\mathbb{P})$

【单调性】

• $\Rightarrow \alpha \circ (f_2 \circ f_1) \circ \gamma(\mathbb{P}) \sqsubseteq \mathfrak{P}_2 \circ \mathfrak{P}_1(\mathbb{P})$

【 f_2 安全性】

• 定理: $\mathfrak{P}_{\mathbf{n}} \circ \cdots \circ \mathfrak{P}_{\mathbf{2}} \circ \mathfrak{P}_{\mathbf{1}} \mathbb{A} f_{n} \circ \cdots \circ f_{\mathbf{2}} \circ f_{\mathbf{1}}$ 的安全抽象。

多条路径整合的安全性

- 给定程序S,其指称语义为f,定义
 - $\mathfrak{P}(\mathbb{P}) = \sqcup_{f_n \circ \cdots \circ f_1 \in p(S)} \mathfrak{P}_n \circ \cdots \circ \mathfrak{P}_1(\mathbb{P})$
- 是f的安全抽象。
- 证明:
 - 给定任意甲 \in 成,对任意 $d \in \gamma(\mathbb{P})$,一定存在 $f_n \circ \cdots \circ f_1 \in p(S)$ 使得 $f_n \circ \cdots \circ f_1(d) = f(d)$ 。
 - 因为 $\mathfrak{P}_n \circ \cdots \circ \mathfrak{P}_1 \in f_n \circ \cdots \circ f_1$ 的安全抽象,则有
 - $\alpha \circ f_n \circ \cdots \circ f_1 \circ \gamma(\mathbb{P}) \sqsubseteq \mathfrak{P}_n \circ \cdots \circ \mathfrak{P}_1(\mathbb{P})$ $\sqsubseteq \mathfrak{P}_n \circ \cdots \circ \mathfrak{P}_1(\mathbb{P}) \sqcup \mathfrak{P}(\mathbb{P})$ $=\mathfrak{P}(\mathbb{P})$
 - $\mathfrak{I}_n \circ \cdots \circ f_1 \circ \gamma(\mathbb{P}) \subseteq \gamma \circ \mathfrak{P}(\mathbb{P})$
 - 因此 $f(d) = f_n \circ \cdots \circ f_1(d) \in \gamma \circ$ [甲]
 - 因为d选择的任意性,所以有 $\alpha \circ f \circ \gamma$ (甲) \sqsubseteq Θ (甲)

常见抽象域

- 设计抽象解释的关键是为具体语句设计函数抽象
 - 比如为四则运算设计函数抽象
- •接下来介绍一些常见抽象域,主要针对数值计算

关系抽象

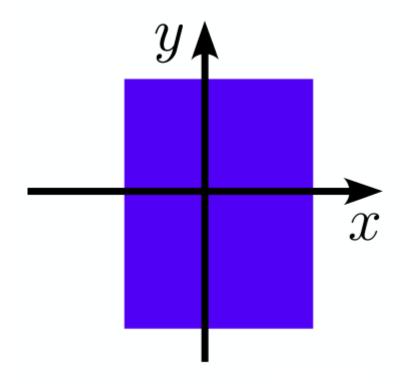

- 在数值计算上我们已经看见过区间分析、符号分析的抽象域
- 区间分析/符号分析单独对每个变量进行抽象, 不考虑变量之间的关系。
- 这类不考虑变量之间关系的抽象称为非关系抽象。

• 考虑变量之间关系的抽象称为关系抽象。

关系抽象举例: 八边形

假设程序中只有x和y两个变量

区间抽象形成一个矩形

加上4条45度的线来形成八边形

关系抽象举例: 八边形

假设程序中只有x和y两个变量

加上4条45度的线来形成八边形

x的上界 a_1 : $x \le a_1$

x的下界 a_2 : $x \ge a_2$

y的上界 a_3 : y $\leq a_3$

y的下界 a_4 : y ≥ a_4

x+y的上界 a_5 : $x+y \le a_5$

x+y的下界 a_6 : $x+y \ge a_6$

x-y的上界 a_7 : $x-y \leq a_7$

x-y的下界 a_8 : $x - y ≥ a_8$

关系抽象举例: 八边形

x的上界 a_1 : $x \leq a_1$

x的下界 a_2 : $x \ge a_2$

y的上界 a_3 : y $\leq a_3$

y的下界 a_4 : y ≥ a_4

x+y的上界 a_5 : $x+y \leq a_5$

x+y的下界 a_6 : $x+y \ge a_6$

x-y的上界 a_7 : $x-y \le a_7$

x-y的下界 a_8 : $x - y \ge a_8$

统一化

x的上界 $\frac{1}{2}a_1$: + $x + x \le a_1$ x的下界- $\frac{1}{2}a_2$: $-x - x \le a_2$ y的上界 $\frac{1}{2}a_3$: +y + y \le a_3 y的下界 $-\frac{1}{2}a_4$: $-y - y \le a_4$ x+y的上界 a_5 : $+x+y \le a_5$ **x+y**的下界- a_6 : $-x - y \le a_6$ x-y的上界 a_7 : +x - y ≤ a_7 **x-y**的下界- a_8 : -x + y ≤ a_8

即 $\pm v_1 \pm v_2 \le a$,其中 $v_1, v_2 \in \{x, y\}$

对多个变量进行抽象

- 对任意两个变量记录八边形
- 即 $\pm v_1 \pm v_2 \le a$,其中 v_1, v_2 为程序上的任意变量
- 可用矩阵表示

	+x	-x	+y	-у
+x	10	-	-	-
-X	-	0	-	-
+y	10	5	20	-
-у	-2	5	-	-10

2个变量的矩阵。更多变量需要更大的矩阵。

八边形上的计算

- x = x + 1
 - 将x有关的八边形沿x轴移动1个单位
- $z = x \cup y$
 - 对于任意变量v, 令<z,v>的八边形为包住<x,v>和<y,v>的最小八边形
- $z = x \cap y$
 - 对于任意变量v, 令<z,v>的八边形为包住<x,v>和<y,v>公共部分的最小八边形
- 更多计算方法参考原始论文:
 - Miné A. The octagon abstract domain[J]. Higher-Order and Symbolic Computation, 2006, 19(1):31-100.

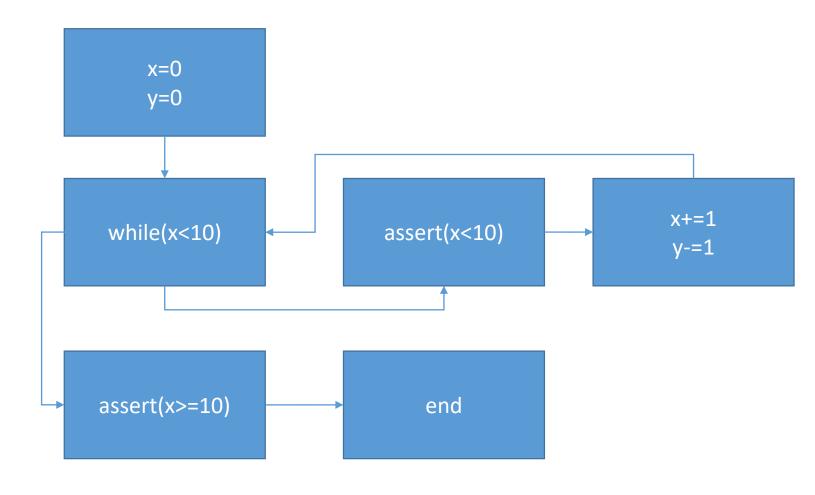

八边形计算举例

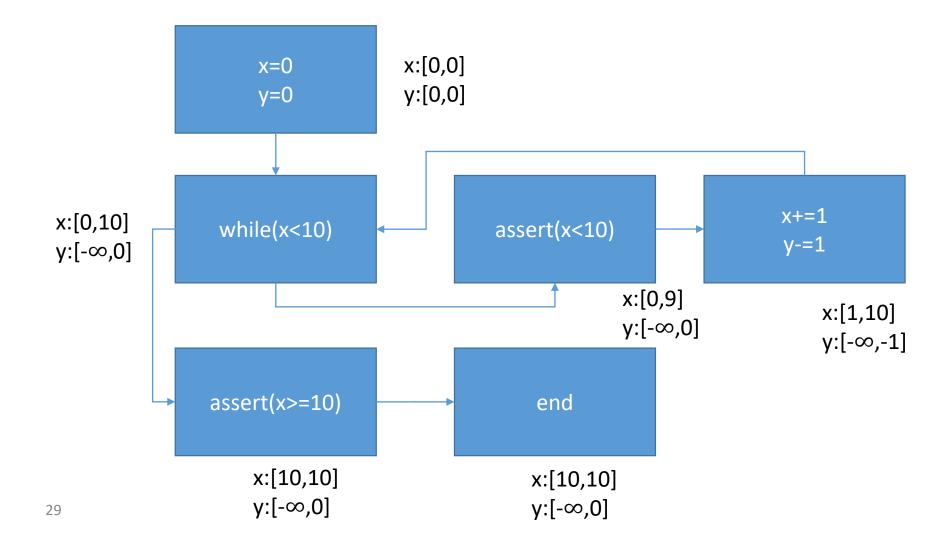

八边形计算举例

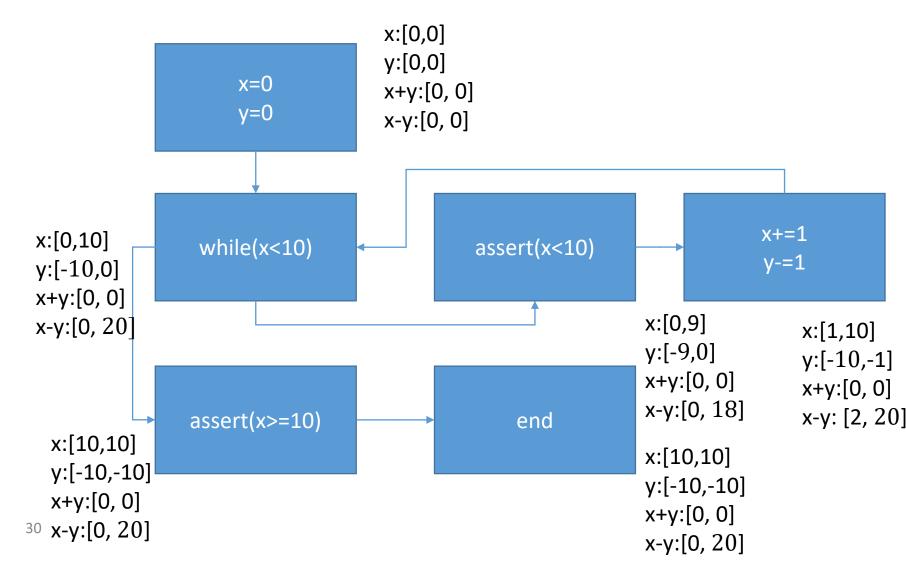

区间计算结果

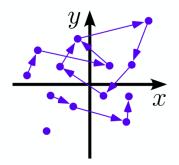

八边形计算结果

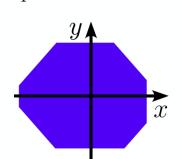

其他数值常用抽象

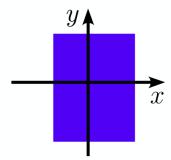

Collecting semantics: partial traces

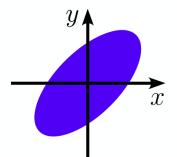

Octagons:

$$\pm \mathtt{x} \pm \mathtt{y} \leqslant a$$

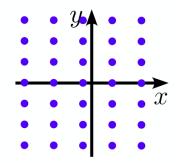

Intervals.

$$\mathbf{x} \in [a,b]$$

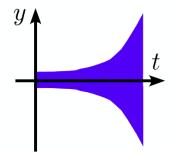

Ellipses.

$$\pm \mathbf{x} \pm \mathbf{y} \leqslant a$$
 $\mathbf{x}^2 + b\mathbf{y}^2 - a\mathbf{x}\mathbf{y} \leqslant d$ $-a^{bt} \leqslant \mathbf{y}(t) \leqslant a^{bt}$

Simple congruences:

$$\mathbf{x} \equiv a[b]$$

Exponentials:

$$-a^{bt} \leqslant y(t) \leqslant a^{bt}$$

谓词抽象

- 用一系列布尔表达式的值作为抽象域
- 其他很多抽象形式可以看做谓词抽象的一种

- 需要针对谓词设计转换函数
- 如,符号分析可以用谓词抽象表达
 - 对任意变量x, 有如下谓词
 - x > 0, x < 0, x = 0

在线抽象解释工具

Interproc

- http://pop-art.inrialpes.fr/interproc/interprocweb.cgi
- 开源工具
 - 用于展示开源抽象域库APRON的静态分析工具
 - 支持整型、浮点型等运算的分析
 - 支持过程间分析(包括递归函数)
 - 不支持数组、结构体等复杂数据结构、也不支持动态内存分配等

The Interproc Analyzer

This is a web interface to the <u>Interproc</u> analyzer connected to the <u>APRON Abstract Domain Library</u> and the <u>Fixpoint Solver Library</u>, whose goal is to demonstrate the features of the APRON library and, to a less extent, of the Analyzer fixpoint engine, in the static analysis field.

This is the Interproc version

Arguments

Please type a program, upload a file from your hard-drive, or choose one the provided examples:

Analysis Result

Run <u>interprocweb</u> or <u>interprocwebf</u>?

Result

) 4 I F (

```
Annotated program after forward analysis
proc MC (n : int) returns (r : int) var t1 : int, t2 : int;
begin
 /* (L6 C5) top */
  if n > 100 then
    /* (L7 C17) [|n-101>=0|] */
    r = n - 10; /* (L8 C14)
                    [-n+r+10=0; n-101>=0] */
  else
   /* (L9 C6) [|-n+100>=0|] */
   t1 = n + 11; /* (L10 C17)
                    [-n+t1-11=0; -n+100>=0] */
    t2 = MC(t1); /* (L11 C17)
                    [-n+t1-11=0; -n+100>=0; -n+t2-1>=0; t2-91>=0|1 */
    r = MC(t2); /* (L12 C16)
                   [-n+t1-11=0; -n+100>=0; -n+t2-1>=0; t2-91>=0; r-t2+10>=0;
                     r-91>=0 | 1 */
 endif; /* (L13 C8) [|-n+r+10>=0; r-91>=0|] */
end
var a : int, b : int;
begin
 /* (L18 C5) top */
  b = MC(a); /* (L19 C12)
                |-a+b+10>=0; b-91>=0|1*/
end
```

Source

end

```
/* exact semantics:
   if (n>=101) then n-10 else 91 */
proc MC(n:int) returns (r:int)
var t1:int, t2:int;
begin
 if (n>100) then
    r = n-10;
 else
    t1 = n + 11;
    t2 = MC(t1);
     r = MC(t2);
 endif;
end
var
a:int, b:int;
begin
 b = MC(a);
```

作业

- 在Interproc中构造一个程序, 使得:
 - 八边形抽象的结果精度>区间抽象的结果精度
 - 最理想的结果精度>八边形抽象的结果精度

• 提交:

- Interproc的运行截图
- 解释你的结果,包括
 - 最理想的结果精度是什么
 - 为什么八边形的结果不如最理想结果精确
 - 为什么区间抽象的结果不如八边形的结果精确
